

Introducing...

“A Clinical Application Proven to Increase the Efficiency of Cancer Treatment and Improve the Outcome of Patients.”

## CancerNAV Summary

**CancerNAV** is a clinical application used to support patient navigators as they manage the treatment path for their oncology patient population through the health system. **CancerNAV** was originally developed at the Cleveland Clinic and is proven to increase navigator efficiency and improve patient access and overall quality of care.

## About Patient Navigation

The patient navigator is a relatively new member of the proven multidisciplinary oncology team. Together, they ensure the patient receives the right treatment, in the right place, at the right time. **CancerNAV** assists by tracking key milestones in each patient's care and optimizing throughput. Critical path treatment tasks are monitored and prioritized through alerts and reminders.

## Improved Efficiency and Outcomes

**CancerNAV** enhances the navigator's ability to identify, track, manage interventions, and provide follow-up for the oncology patient population, in a seamless and real-time basis. Time to treatment is reduced, which has been demonstrated to reduce patient stress and improve outcomes. Less stressed patients utilize less services, and are more likely to stay with the program, improving the bottom line. With **CancerNAV**, the navigator can provide these improvements to patient care while handling more patients than before, improving productivity and providing a positive work experience for these important knowledge workers.

## About Family Care Path

Family Care Path develops web-based clinical applications designed to improve patient outcomes and increase physician and clinical process efficiency. The **CancerNAV** app can be customized and interfaced with a variety of EMR systems, and is one of several applications currently offered by Family Care Path.

## Numbers at a Glance

\*In studies at the Cleveland Clinic, utilization of **CancerNAV** resulting in the following:

Sooner treatment means less patient anxiety and has been shown to improve outcomes. Stressed patients require additional resources, placing added burden on the healthcare system.

**CancerNAV** allowed navigators to work with significantly more patients while at the same time improving treatment. This had a positive effect on job satisfaction for the navigator.

Well-cared-for patients stay with the program, retaining revenue for the health care system, and likely leading to increased “word of mouth” referrals of new patients.
